## **CF 518 Universal Infra Red Remote Control Programming Instructions**

Make sure batteries are fitted to the remote control (2 X AAA)

Make sure that the A C unit to be programmed is switched ON

Check through all listed codes on the remote control packaging to see if your AC unit is listed. There may be more than 1 code listed.

Make sure that the model number on the remote control is flashing, if not, press the reset button.

If you have the code for the AC unit, use the code select keys to select the code, face the remote control at the infrared sensor on the AC unit, then press enter, and check if unit responds. If yes unit should work correctly, if not repeat procedure with all other available codes. Take note that the remote will need to be reset after each attempt.

If there is still no response a manual search will need to be done.

Make sure the model no is flashing, point the remote control at the unit, and by using the auto button go through all 508 codes. Be sure the remote transmits each time or you may miss your code. (The transmit sign should flash each time) When you reach a setting that responds (normally a beep will be heard) press the enter button. The unit is now programmed. Make a note of the code that you have selected, so if you need to change the batteries you can easily program the control again.
